

PROPERTY AND OBJECT VALIDATION IN A DATABASE SYSTEM

ABSTRACT OF THE DISCLOSURE

Property and object validation is provided
5 in a framework for authoring database systems. The
framework treats a property as an object and provides
a mechanism to allow constraints to be enforced on
the values entered in the properties. Some objects of
an application have properties that have dependencies
10 on other properties for setting. The framework of the
present invention also allows easy enforcement of
such dependency constraints.
